

ReLook Prompt Cheat Sheet

Exhibition Booth Visualisation — Sydney Exhibition

EXHIBITION

SYDNEY

Prompt patterns for turning sketches, line drawings, and real booth photos into photorealistic exhibition stand renders. Platform: relook.hthsystems.com.au

Master Prompt 1 — Sketch / Line Drawing → 3D Render

Hand Sketch or Line Drawing → Photorealistic Booth (Actual Prompt Used)
Image 1 = Hand sketch or line drawing of the booth (STRUCTURE MASTER)

Photorealistic 3D render of a modern exhibition booth based on a conceptual sketch.

Transform the sketch into a fully built structure with **realistic geometry, clean edges, and accurate proportions.**

Booth design: A **[CLIENT]** branded expo stand with **[angular / curved / open]** architecture, illuminated fascia, and a reception counter at the front. Integrated lighting within edges and signage. Demo pods and display areas inside the booth. Clean platform flooring with **[carpet / vinyl / timber]** finish.

Materials: **[e.g. Matte white laminated panels]** , **[brushed aluminium framing]** , **[soft LED strip lighting]**

Master Prompt 2 — Material Interpolation (2-Image Method)

Apply Materials from One Photo onto Another Structure (Actual Prompt Used)
Image 1 = The booth sketch or structure you want to render **Image 2** = A real booth photo whose materials/finishes you want to apply

"Generate a photorealistic 3D render of the 1st pic using the materials of the 2nd pic"

The AI uses Image 1 as the structural blueprint and Image 2 as the material palette — extracting the finishes, textures, and lighting style and applying them to the new design. **Use Premium 2K + Enhancer Ready for best results.**

Booth Variations — Colour, Material & Branding Swaps

COLOUR / FINISH VARIATION
"Show the same booth in **[navy blue / charcoal / white gloss / timber natural]** — keep the structure and layout identical"
Used for Aspen booth variations — generate 3-5 colourways from one render

REMOVE ALL BRANDING
"Remove all logos, brand text, and signage from this booth. Show a clean, neutral stand ready for re-branding"
Creates a blank template for re-use across multiple client pitches

BRAND SWAP — NEW CLIENT
"Re-brand this booth for **[new client name]** using their brand colours **[colour 1]** and **[colour 2]** — replace all logos and fascia text"
Same physical stand, new client — fast pitch visual without rebuilding

PANEL / FASCIA MATERIAL
"Change the booth panels from **[current finish]** to **[gloss white / brushed aluminium / dark timber veneer / fabric wrap]**"
Material changes dramatically shift the perceived quality — generate before showing client

Before → After & Targeted Fixes

BEFORE → AFTER (SITE PHOTO)
"Take this photo of the **raw or partially built stand** and show it as a **finished, lit, fully dressed exhibition booth**"
Turns a bump-in site photo into a finished client-facing visual

INPAINT — FIX SPECIFIC AREA
"Change only the **[reception counter / rear wall / flooring]** — paint over the area in pink and describe what replaces it"
Use inpaint mode for targeted changes without regenerating the full booth

ADD LIGHTING TO EXISTING
"Add **integrated LED strip lighting to the fascia edges, warm spotlights on the display areas,** and backlit signage panels"
Brightens a flat booth photo — clients respond strongly to lit renders

ADD PEOPLE / ACTIVATE SPACE
"Add **professional visitors in business attire** interacting with the stand — some at reception, some at demo pods, none overcrowding"
Activating an empty booth makes proposals feel real — essential for client decks

Power Tips

- 1

Sketch quality doesn't matter. Even a rough hand sketch works as Image 1. The AI interprets intent — not line quality.
- 2

Material interpolation is your superpower. Upload any booth you love as Image 2 and the AI copies its finishes onto your new design.
- 3

Name materials specifically. "Matte white laminated panel" beats "white wall". "Brushed aluminium trim" beats "metal". Precision = accuracy.
- 4

Premium 2K always for client-facing booth renders. Fast model for quick internal checks only.
- 5

Generate a "no branding" base first. Then apply client branding as a second prompt — easier to pivot when the client changes brief.
- 6

Variations in one session. V1 = structure. V2 = different colour. V3 = branding applied. Each builds on the last — don't restart.
