

Prompt patterns for logo swaps, element compositing, sketch-to-render, and multi-panel graphics on signage and booth structures. Platform: relook.hthsystems.com.au

Logo & Element Swaps (Actual Prompts Used)

LOGO SWAP — 2 IMAGES

"Change the **logo** in the first pic with the **logo in the 2nd pic**"

Image 1 = signage scene. Image 2 = new logo. AI composites with correct perspective.

ELEMENT SWAP — 2 IMAGES

"Remove the **surfboard** in first pic and swap with the **mascot in the 2nd pic**"

Remove + replace in one prompt. Works for mascots, props, display elements.

Sketch → 3D Render (Master Prompt)

Line Drawing → Branded Booth Render (Actual Prompt Used)

Image 1 = Booth line drawing (structure master)

"Photorealistic 3D render of a modern exhibition booth based on a conceptual sketch. Transform the sketch into a fully built structure with realistic geometry, clean edges, and accurate proportions."

Booth design: A [CLIENT] branded expo stand with [angular / curved / open] architecture, illuminated fascia, and a reception counter. Integrated lighting within edges and signage.

Materials: [Matte white laminated panels] , [brushed aluminium framing] , [soft LED strip lighting]

For a neutral base: "Generate the rendered version of these line drawings, **neutral colour palette**" — then apply branding as a second step.

Multi-Image Panel Graphics — Signage Superpower

Apply Graphics to Named Panels (Actual Prompt Used)

Image 1 = Booth with labelled panels (A, B, C) Images 2-4 = Graphic designs for each panel

"Add the graphics on panels A, B, C of the first pic using the image 1, 2 and 3"

The AI maps each graphic to its designated panel, auto-matching perspective, lighting, and scale. **Label your panels clearly in the booth structure image.** Up to 4 reference images supported.

Lighting, Background & Furniture Control

LIGHTING / TIME CHANGE

"Change **lighting to midday**"

Shifts entire scene — shadows, sky, reflections update. Works for night→day, indoor→outdoor feel.

BACKGROUND REMOVAL

"Remove the **background** — keep the scene intact"

Isolates signage with transparency. Ready for composite into any venue or proposal.

FURNITURE SWAP — 2 IMAGES

"Swap the **chairs in 1st pic** with the **chair in 2nd pic**"

Pull specific furniture from a reference photo into your booth. Instant variation.

MATERIAL / FINISH CHANGE

"Change the booth panels from [current] to **[gloss white / brushed aluminium / timber veneer]**"

Material changes shift perceived quality. Generate before showing client.

Power Tips

- 1

Generate neutral first. Create an unbranded booth render, then apply client branding as a second prompt. Easier to pivot when briefs change.
- 2

Label panels clearly. When using multi-image panel graphics, mark panels A, B, C on your booth image. The AI reads the labels.
- 3

Name materials precisely. "Matte white laminated panel" beats "white wall". "Brushed aluminium trim" beats "metal". Precision = accuracy.
- 4

Premium 2K always for client-facing signage renders. Fast model for quick internal layout checks only.
- 5

Iterate, don't restart. V1 = structure. V2 = branding. V3 = graphics. V4 = lighting. V5 = furniture. Each builds on the last.
- 6

Background removal for composites. Remove background from a signage render, then place it into a venue photo for proposals.
